

ABSTRACT

An animated or non-animated body candy pop device comprising a main housing or body including a pliable material with a wire or stiffener in the body so that the body can be shaped into different shapes. The main housing can be solid or hollow and made with an expandable sleeve in the body for receiving an end of a candy stick on which a pop is secured. The pop can be formed directly on one or more appendages of the body instead of using the stick holder. The candy can be replaced with any type of lollipop. The device can be made in different body styles such as animals, fish, and insects, etc., to provide fun and entertainment for children of all ages.
